TECS DIN MODULAR DEVICES

- **Our Belief**

Safety and protection are the prime purposes of Terasaki products. You care about safety and protection. The people who depend on products you specify care about safety and protection.

- **Ratings**

Our range of DIN modular protection products covers ratings from 2A-125A.

- **Circuit Breakers**

For overload and short-circuit protection.

- **Residual Current Devices**

Designed for the prevention of electrical shock and fires.

- **Combination**

Circuit Breakers with functions combining overload, short-circuit and residual current protection.

- **There is a solution for your applications**

Contact us today.

## 次代に応える技術価値、企業価値の創造を

当社は1923年の創業以来、電気エネルギー制御技術をベースにした配電制御システム、ブレーカ、電子デバイスの製造に努め、船舶、建築、産業部門に貢献してきました。日本の産業構造の大きな変容、技術の世界標準志向や市場のグローバル化など激動の時代にあって、真に価値ある企業活動を推進することは容易ではありません。そんな中、当社は長年に渡り蓄積されたノウハウと実績を基盤に変革と刷新の志をもって、3事業分野におけるリーディングカンパニーとして邁進していきたいと考えます。産業と、環境と、暮らしの明日をみつめ、テラサキは進化し続けます。

*Creating technical values and corporate values for the next generation.....*

Since our founding in 1923, TERASAKI has manufactured electric distribution and motor control systems, circuit breakers and electronic devices based on electrical energy control technologies and through our pursuit of excellence made solid contributions to the shipbuilding, construction and manufacturing industries. Yet in the turbulent times of great transformation in Japan's industrial structures, technology's path towards worldwide standardization and globalization, it is not an easy task to promote corporate activities of true value. Amidst the situation, we stand strong on our know-how and performance records accumulated over the many years and are marching forward with a will for innovations and restructuring to be a leading company in these three business fields. TERASAKI will continue to strive towards excellence with considerations on outlook on the future of industry, the environment and lifestyles.

## TECHNICAL DESCRIPTION

*For use in commercial and industrial electrical distribution systems  
Protects against overloads and short circuits, switching and isolation.*

### TRIP CHARACTERISTICS

#### TYPE "B" CHARACTERISTICS

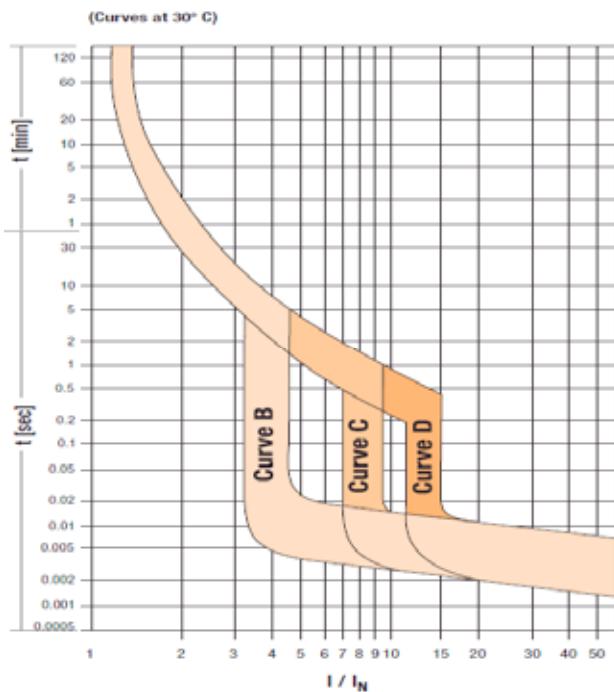

Developed primarily to protect conductors and low level signal devices such as PLCs. Instantaneous trip is three to five times the rated current of the Supplementary Protector ( $3\sim 5 \times I_N$ ). The fast trip time of these devices minimizes damage to control circuit conductors from low-level faults.

#### TYPE "C" CHARACTERISTICS

Developed primarily for applications with moderate inrush currents such as lighting, control circuits and appliances. Instantaneous trip is five to ten times the rated current of the Supplementary Protector ( $5\sim 10 \times I_N$ ). The higher instantaneous trip level prevents nuisance tripping, and components being protected can typically withstand higher fault currents without being damaged.

#### TYPE "D" CHARACTERISTICS

Developed primarily for applications with high inrush currents, i.e., transformers, and motors. Instantaneous trip is ten to twenty times the rated current of the Supplementary Protector ( $10\sim 20 \times I_N$ ). The high instantaneous trip level prevents nuisance tripping, and components being protected can typically withstand higher fault currents without being damaged.

### DC CIRCUITS USE

Thermal Characteristics for TECS breakers are unaffected by the current applied, that is either direct current or alternating current. The magnetic trip current value increases by 40%. Eg. In the case; a breaker of tripping characteristic B and 10A rated current, its magnetic tripping value will be between 30A and 50A in alternating current. The magnetic tripping value for this very same breaker in direct current will be between 42.4A and 70.7A .

For DC service, the MCBs full rated breaking capacity can be achieved without any reduction in performance by connecting protected poles in series. For values up to 48V=, 1 protected pole can be used unimpaired of the breaking capacity value. Between 48 and 100V=, 2 protected poles series connected can be used without reduction in the breaking capacity. Between 110 and 150V=, 3 protected poles series connected must be used, and 4 poles up to 200V=. Connected must be used, and 4 poles up to 200V=.

**TERASAKI**  
Innovators in Protection Technology

# EP SERIES

## SPECIFICATION

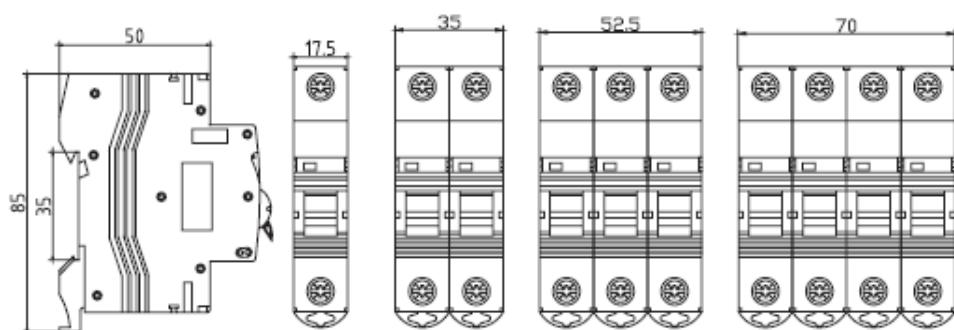

### SPECIFICATIONS

Rated Capacity	Phase to Neutral 230V/240V~ / Phase to Phase 400V/415V~
Rigid Conductor	25mm <sup>2</sup> Maximum
Flexible Conductor	16mm <sup>2</sup> Maximum
Characteristics	B CURVE / C CURVE / D CURVE
Capacity	6 kA / 10kA
Standards	EN 60898 / EN 60947-2 / KEMA / SEMCO / SNI / CE / ROHS
Frequency	50/60Hz
Calibration Temperature	30°C
Electrical Endurance	8000
Mechanical Endurance	20000

### DIMENSIONS

# TECS RCCB

## TECHNICAL DESCRIPTION

*Providing protection against overload and short-circuit currents and protects people against earth fault currents: direct or indirect contact, fire.....*

### TRIP CHARACTERISTICS

The RCD employs the current balance principle which involves the supply conductors to the load (phase and neutral) wound onto a common transformer core to form the primary windings. Under healthy conditions, the current in the phase conductor is equal to the current in the neutral and the vector sum of the current is zero.

In the event of an earth fault, an amount of current will flow to earth, creating an out of balance situation in the transformer assembly. This out of balance detected by the secondary winding of the transformer will activate the trip mechanism at a pre-determined level. Single phase and neutral or three phases and neutral units (suitable for both 3 wire and 4 wire systems) are available, the latter being suitable for balanced or unbalanced 3 phase loads.

The RCD tripping mechanism will operate at a residual current of between 50%-100% of its rated tripping current. (Sensitivity)

### RESIDUAL TRIPPING CURRENTS

10mA	Suitable for use in special applications where additional protection against contact is essential
30mA	Tripping current to provide additional protection against direct contact shock
100mA	Suitable for use against direct contact shock or where protection is guard against fire hazards etc.
300mA	Suitable for use in large installations where equipment protection are main considerations and high levels of earth leakage are experienced.

### FAULT CURRENT SENSITIVITY

Semi-conductor devices are extensively integrated in equipments in industries, commerce and in our homes. They can be found in control panels to computers to toys.

As equipments are fed from the mains electrical supply; in the event of an earth fault, the presence of semi-conductors may result in the normal AC waveform being replaced by a non-sinusoidal fault current. In some cases, the waveform may be rectified. These waveforms are said to contain a pulsating DC component which can either partially desensitize a standard type AC RCD.

International standards IEC 1008 (RCCBs) and IEC 1009 (RCBOs) divide RCDs into two performance classes:

#### Type AC

RCDs for which tripping is ensured for residual sinusoidal alternating currents; whether suddenly applied or slowly arising.

#### Type A

RCDs for which tripping is ensured for residual sinusoidal alternating currents and residual pulsating direct currents, whether suddenly applied or slowly arising.

Rated Current (In)	6, 10, 15, 16, 20, 25, 32, 40A
Rated Voltage (Un)	230VAC
Breaking Capacity	6KA
Rated Tripping Current	30mA, 100mA, 300mA
Characteristics	B, C CURVE
Number of Poles	1P+N
Type of Terminal	LUG TYPE
Terminal Capacity	25mm <sup>2</sup> Maximum
Width	17.6mm / Module
Standards	IEC61009, EN6009

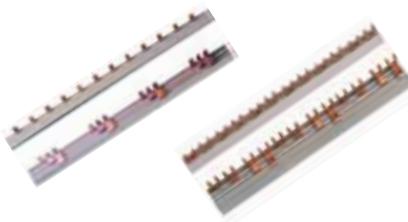

### DIMENSIONS

## COMPLEMENTING OUR

# ACCESSORY DIN MODULAR DEVICE RANGE

### INSULATED PIN TYPE BUSBAR / INSULATED FORK TYPE BUS BAR

#### Current carrying capacity

Feed-in from the end cross section mm <sup>2</sup>	$I_s$	$I_E = I_s$					
max. current $I_s/\text{phase}$ (A)		10	12	16	20		
63	65	80	90	63	80		
Feed-in from the middle	$I_E = \Sigma I_s$						
n 3 2 1 1 2 3 n	$I_s$	100	110	130	150	100	130
max. current $I_s/\text{phase}$	$I_E = \Sigma I_s$				Depends on the cross section for connection		

If you feed-in from the middle you have to observe that the sum of the outgoings is not higher than the max. current of the busbars  $I_s/\text{phase}$ .

### SHUNT TRIP / UNDER VOLTAGE TRIP / AUXILIARY CONTACTS

#### SHUNT TRIP RATINGS

- Shunt trip 12-48VAC / VDC
- Shunt trip 110-415VAC and 110-125VDC

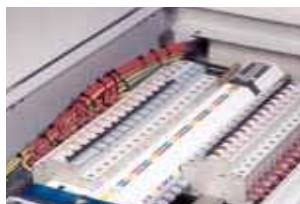

#### UNDER VOLTAGE TRIP RATINGS

- UVT 12-48VAC / VDC
- UVT 110-415VAC and 110-125VDC

#### AUXILIARY CONTACT RATINGS

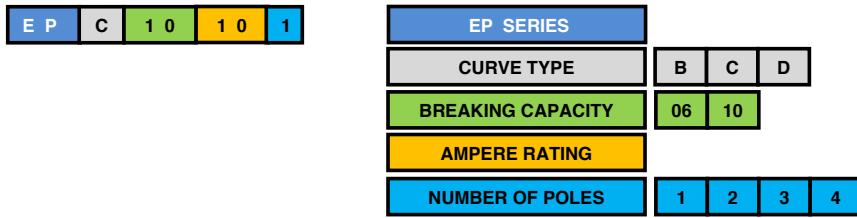

- AUX 1C / 2C
- UVT 110-415VAC and 110-125VDC

### LOAD CENTRE

Our load centre has been designed to take incoming supplies of 125A, 160A and 250A, with outgoing terminals at 18 mm or 25 mm centres and 27 mm.
